Reliability Rules: Theory and Practice With a Look to the Future

Larry Bruneel

Harvard Electricity Policy Group

Fifty-fourth Plenary Session

The Lodge at Torrey Pines, La Jolla, CA

March 12th, 2009
Always had rules so what is different now?

Publicity

Sanctions

Independent review
Publicity -  

Blackouts were obvious. Now the public hears about near misses and warning signs (and about preventative measures like tree trimming!)
Sanctions –

The cost of penalties is now weighed against the benefits of violations
Independent review –

Less chance for the “old boys network” to work its magic. Audit teams are taken seriously.
Enforcement will always need more resources

There will always be delays and backlogs in adjudication. But, information is more important than ever –

Is NERC getting the right information? Is FERC? Is TOOF a help or a vestige?
Why is credible and effective reliability regulation important?
Unprecedented growth in transmission which will go beyond traditional boundaries.

SCE
AEP
ITC
Reliability record is a key measure for regulatory approval
What are the next steps?
NERC/FERC process going well.

Vegetation management issue was an interesting kink. Ultimately successful but necessitated a different communications approach and even changed some corporate strategies. Should serve the industry well for the future - self-policing is growing in effectiveness.
NERC mission expansion is a good thing.

End thought – Should planning be done at NERC?
