Transmission is not the question

Tom Welch
Boston
November 20, 2003
The Eternal Triangle

- Generation, transmission and demand are part of the same equation
- The market and regulatory structures are inconsistent
- Vertical integration remains a problem
- Can policy find a “Theory Of Everything?”
Why LMP is Good

- Identifies the cost of not acting
- Provides a benchmark against which to measure “solutions”
Why Excess Socialization of Transmission Costs is Bad

- The uneven treatment problem
- The gold plating problem
- The equities problem
Does the Blackout Change the Equation?

- It wasn’t the hardware that broke
- Suggests need for balancing import and production
ISO (RTO) Planning Role

- Favor single buyer capacity purchase model
  - Treats generation, transmission, and demand equally
  - Accommodates zonal differences
  - Allows for specific designation of type of resource where appropriate

- Role of RSC
Long Term Contract Issue

- Single buyer model provides comparable financial support
- Definition of “long term” is unresolved
  - Provide lead time and secure financing
  - Minimize estimation error
Granularity

- As much political as economic question
- Intra-state subsidies are less troubling than inter-state (intra-regional) transfers
